SAFETY
SOFTWARE

SINCE 1981

Save time...
Save money...
Save lives.

Streetwise Software from ADSi...

the safety of your city depends on it.

Public Safety Software from ADSi is tested on the streets, in real life situations, before it reaches your system. ADSi software can improve efficiency and response times, resulting in better service to the citizens you protect and increased safety for your field personnel. Our systems gather information and generate documentation to help save time and money in all public safety departments. So take advantage of our "street smarts" and start running your city more efficiently...and safely.

DATAforce

Master Index System is an integrated records management system that lets you receive data from all other ADSi modules. Search for suspects (with 11 different search options), property and vehicles. Pinpoint where information is located within the system.

Property and Evidence System lets you efficiently and accurately manage your property room. Easily track property by location, description or defendant's name. Check in/check out controls ensure security. Interfaces to ADSi Master Index for system-wide tie-in to property room.

Field Interview and Warning Ticket System. Data from field interviews and warning tickets can be used to track subjects and violations, collect data and renew field reports. Data searches available in eight categories and it's easy to print batch reports. This data can be accessed via the Master Index system.

Pawn Shop Control System will automate your pawn records and make it easy to track pawn habits and trends in your area. Identify suspects that pawn multiple

items in multiple shops. Master Index system allows investigators to call up pawn data to cross match with stolen items. Also interfaces with state agencies.

Traffic Accident System lets you collect and utilize traffic accident data. Reports can be customized to correspond to state reporting systems. Search features make it easy to locate records and you can generate reports to pinpoint problem areas.

Municipal Court Management System streamlines paperwork intensive court documentation. Integrates all aspects of courtroom management including docket, offender information, recording verdicts and case history. Allows you to keep track of fee collections and disbursements as well as generate reports and letters related to court fines and/or appearances.

CADforce

Computer Aided Dispatch is fast and accurate. CADforce can improve response time and enhance officer safety. This program is customized with community specific information, provides easy interface with other agencies and generates valuable data for records.

MDTforce

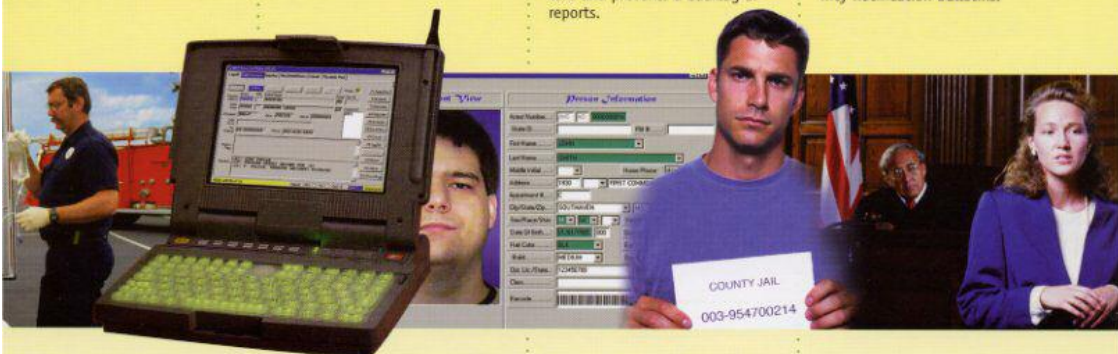

Mobile Data System gives your field units access to vital electronic information systems and lets them communicate electronically car to car, car to dispatch or car to any email address in your system. Reports can be in your data bank while your units are still in the field.

WRITEforce

Field Reporting System lets your personnel write reports in the field on conventional or pen-based laptop. This system is designed to speed report entry with easy to use standardized forms, time buttons, slide bars, and drop down menus. It also eliminates redundant data capture and prevents a backlog of reports.

IMAGEforce

Mug Shot Imaging System gives you a photo-based line up of suspects when you search by name or demographics. Drop photos into records, posters and security documentation. Recall old mug shots for updating at time of booking. Create employee IDs, wanted posters or community notification bulletins.

Jail Management System

efficiently and accurately keeps track of prisoner data, including costs for care and confinement. Enhances prisoner and personnel safety by managing "keep aways", visitors and work schedules. The booking process is simplified and warrants will be cleared automatically. This system even calculates prisoners' sentences including good time or problem behavior.

Warrant Control System lets you easily issue, serve and clear warrants. Interface with NCIC and state systems allows for electronic transmission of warrants. When linked to CAD system, officers can check for warrants before approaching stopped vehicles.

Criminal History System keeps a running history of each person booked, establishes a prior sheet. Once a person is booked into the

system, data can be reused or added to, which reduces data entry on re-arrests. Just call up old records and add only new information. Ideal for law departments who book suspects, but don't need a total jail management system.

Juvenile Arrest System is a complete module designed just for juvenile arrests. Capture personal information, MOs and write free-form narrative information. All data can be secured by controlled access. Searches and batch reports are easy to obtain.

Confidential Informant System lets you compile records for all cases involving a confidential informant as well as record and secure pertinent information. Helps supervisors verify that compensation paid to CIs follows department regulations.

Domestic Violence System

captures information unique to domestic violence cases from the original call through prosecution. Reports of incidents can be displayed by location, spreadsheet, chart or graph form. When combined with IMAGEforce, photos of injuries can be electronically attached to files.

Case Management System lets investigators instantly compile and view all documents relating to a case. The system even tracks relationships contained in various reports. Supervisors can quickly complete case reviews for individuals, units or the entire detective section.

False Alarm Billing System reduces the number of false alarms and lets you recapture your costs for responding to false alarms. Now you can track all false alarms and set parameters for automatic mailing of a warning letter and a bill for services.

Personnel Control System

keeps track of basic personnel information and more. Now you can have an up-to-the-minute history for each employee, including goal setting and important training information.

Outside Information Systems is a system that lets your personnel access national, state and local databases. Some of the systems available include NCIC, NLETS, E-911, DMV and local warrant control.

Incident Reporting System keeps track of all the important data your personnel collect each time they file a report. With this system, forms can be modified to meet state and national reporting criteria. It is designed to work for multi-jurisdictional or single reporting districts. You can pull batch reports for end-of-the-month reporting and analysis.
